

EUCIC survey: Infection Control Team's Opinion About Influenza Vaccination

Health care workers (HCWs) are at risk for infection by influenza. For this reason, the annual influenza vaccine is recommended for HCWs not only to protect themselves but also to protect other HCWs and, most importantly, their patients. However, **influenza vaccination rates among HCWs are usually lower than expected**, with variations and differences observed between countries.

The hospital infection control teams have a potential to change HCWs' attitude and practices towards influenza vaccination.

Through this **survey, performed by the European Committee on Infection Control (EUCIC), available in ten languages (Dutch, English, French, German, Greek, Italian, Romanian, Russian, Spanish, Turkish)**, we aim to **understand the attitudes of the infection control teams** on influenza vaccination in different countries and their rationale for accepting or rejecting influenza vaccination. **Results and conclusions derived from this survey will help shape future strategies.**

The survey will be open from 17 May until 15 July 2019.
